

Anonymity

Matěj Grégr

mgregr@fit.vutbr.cz

Agenda

- Anonymity
- IP Addresses
- Onion, garlic routing
- Interesting projects

Anonymity?

- The IP address can be bound directly to the user
 - ISP stores communication information
 - Typically stored for a certain time (Data Retention)
 - Law enforcement agency
- Browser fingerprinting
 - Cookies, Flash Cookies, E-Tags, HTML5 Storage
 - Browser fingerprinting
 - Lightbeam extension in FF
- User fingerprinting
 - User Activities - which application it uses, which sites it accesses

Fingerprinting – OS DNS

Fingerprinting – user behavior

Dominik Herrmann, Christian Bause, Hannes Federrath: Behavior-based tracking: Exploiting characteristic patterns in DNS traffic

Anonymity in crowds

- China surveillance
- Amazon Face recognition
 - Royal wedding: <https://news.sky.com/whoswho>

Who uses anonymous access?

- "If you do nothing wrong, you have nothing to hide."
 - Anonymous only want to be criminals?
 - Journalists
 - Law enforcement
 - Promoting human rights
- Avoiding sanctions
 - Not every country permits the right to freedom of expression
- Avoiding "chilling-effects"
 - Controversial, unpopular thoughts

Definition?

- Unlinkability

- Inability to link two events
 - E.g. packets, web access, people, actions
- Three parts:
 - Sender anonymity (Who sent it?)
 - Receiver anonymity (Who is the recipient?)
 - Relationship anonymity (Are A and B in some connection?)

- Unobservability

- Monitored events cannot be distinguished from others

IP address

- IP - globally unique identifier
- Network entry point

Your IP address is:

147.229.192.6

ISP: Brno University of Technology

Hostname: kn.vutbr.cz

Country:  Czech Republic

State: Jihomoravsky Kraj

Hub City: Brno
(Routed Internet Connection)

Timezone: Europe/Prague

Browser:  Mozilla Firefox 26.0

OS:  Linux x86

Screen Res.:  1920x1200

Referrer: google.com

IP address – allocation IANA to RIR ①

- Internet Assigned Numbers Authority (IANA)
- <http://www.iana.org/assignments/ipv4-address-space/ipv4-address-space.xml>

IP address–RIR to LIR to ISP ②

- Provider independent / aggregatable addresses
- Who is the ISP of the address - country, city

IPv4 address – assigned to the user

- DHCP, PPPoE
- The ISP stores the information asked (MAC, DHCP82, username) and what address has been assigned

IPv6 address - assigned to the user

Router Advertisement

```
src: fe80::204:96ff:fe1d:4e30

```

B

IP address

- IPv4
 - Typically, an ISP always has information about which user has assigned which IPv4 address
- IPv6
 - Prefix allocation - similar to IPv4
 - Address allocation (metro Ethernet) - more problematic information retrieval
- ISP keeps this information almost always even **without** DR
 - Tracing problems, billing...

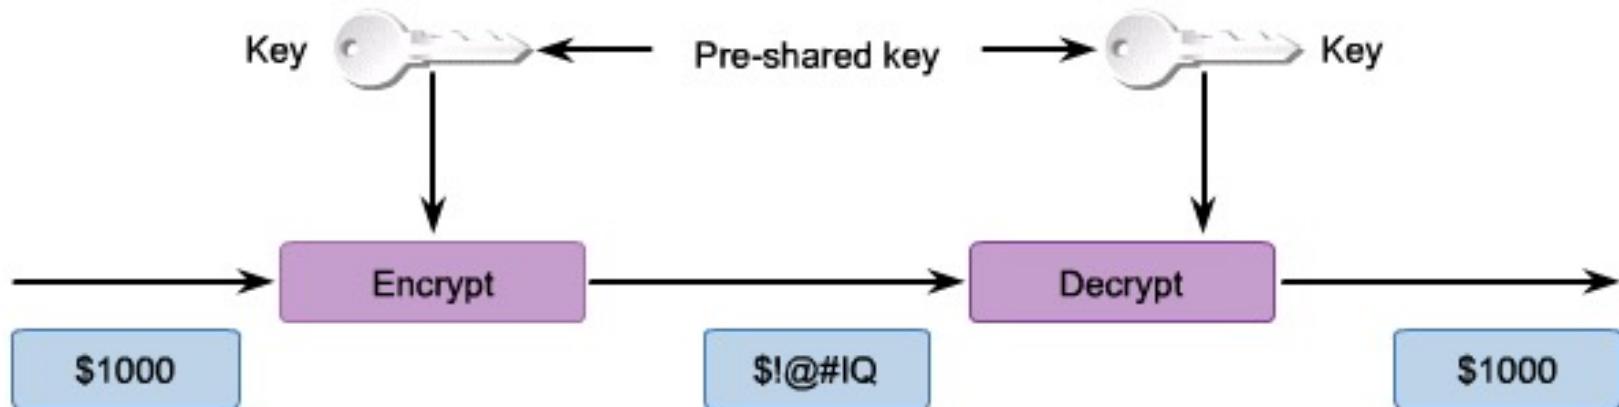

Encryption?

- Content could not be read
- Does not provide anonymity
 - source and destination are known

Symmetric cryptography

- Shared Key Algorithms, used for both encryption and decryption
- The same key is known to both sides, the security lies in key protection

Symmetric cryptography

- Plaintext message M
 - E - symmetric encryption algorithm
 - K - key

$$M \rightarrow E(K, M) = C \rightarrow E(K, C) = M$$

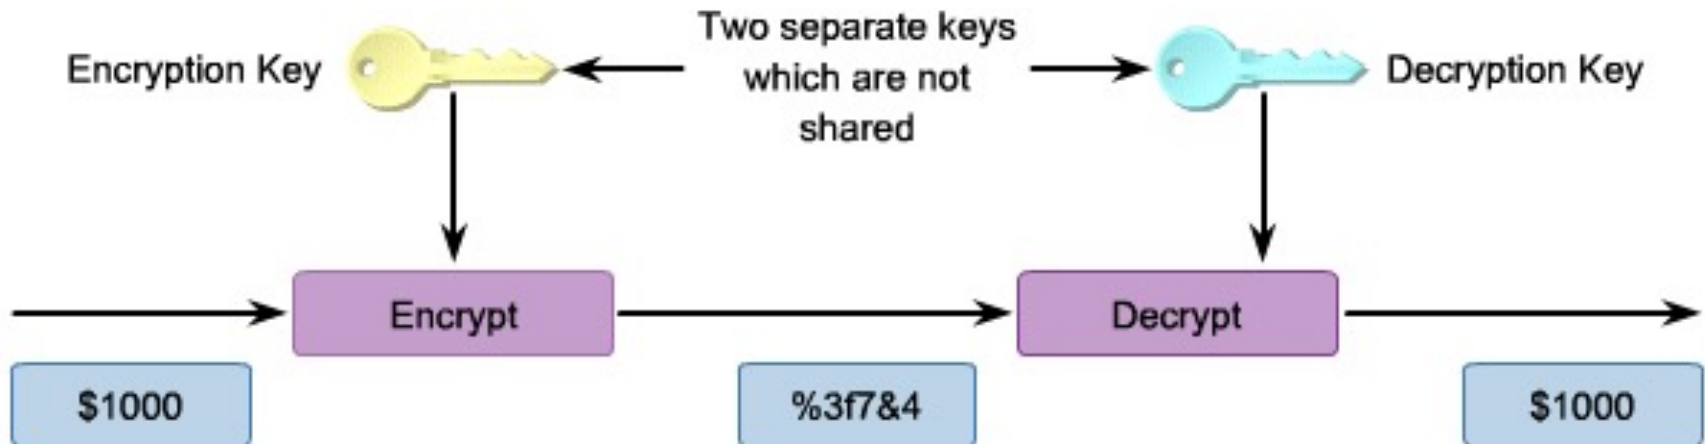

- Advantages
 - Speed, simplicity
- Disadvantages
 - Key distribution

Symmetric cryptography

| Symmetric Encryption Algorithm | Key length (in bits) | Speed | Time to Crack | Description |
|------------------------------------|---------------------------------------------------------------------------------|--------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DES 1976 | 56 | Medium | Hours Days | Designed at IBM during the 1970s and adopted as the NIST standard until 1997. Although considered outdated, DES remains widely in use. DES was designed to be implemented only in hardware, and is therefore extremely slow in software. |
| 3DES 1977 | 112 and 168 | Low | Days Months | Based on using DES three times which means that the input data is encrypted three times and therefore considered much stronger than DES. However, it is rather slow compared to some new block ciphers such as AES. |
| AES 2001 | 128, 192, and 256 | High | Years | AES is fast in both software and hardware, is relatively easy to implement, and requires little memory. As a new encryption standard, it is currently being deployed on a large scale. |
| SEAL 1997 | 160 | High | Years | SEAL is an alternative algorithm to DES, 3DES, and AES. It uses a 160-bit encryption key and has a lower impact to the CPU when compared to other software-based algorithms. |
| The RC series 1987,94,98 | RC2 (40 and 64) RC4 (1 to 256) RC5 (0 to 2040) RC6 (128, 192, and 256) | Fast | Years | RC algorithms are a set of symmetric-key encryption algorithms invented by Ron Rivest. RC1 was never published and RC3 was broken before ever being used. RC4 is the world's most widely used stream cipher. RC6, a 128-bit block cipher based heavily on RC5, was an AES finalist developed in 1997. |

Asymmetric cryptography

- A pair of linked keys - public and private
- Compared to symmetric algorithms, the key length is much larger to provide the same level of security
- Asymmetric algorithms are computationally intensive (100x to 1000x slower)

Private and public key

- Only the owner knows and owns the private key
- The public key is available to anyone
- Both keys are different and it is computationally "impossible" to derive the one key from the other
- Each key can be used for both encryption and decryption
 - private encrypts, public decrypts
 - public encrypts, private decrypts

Asymmetric cryptography

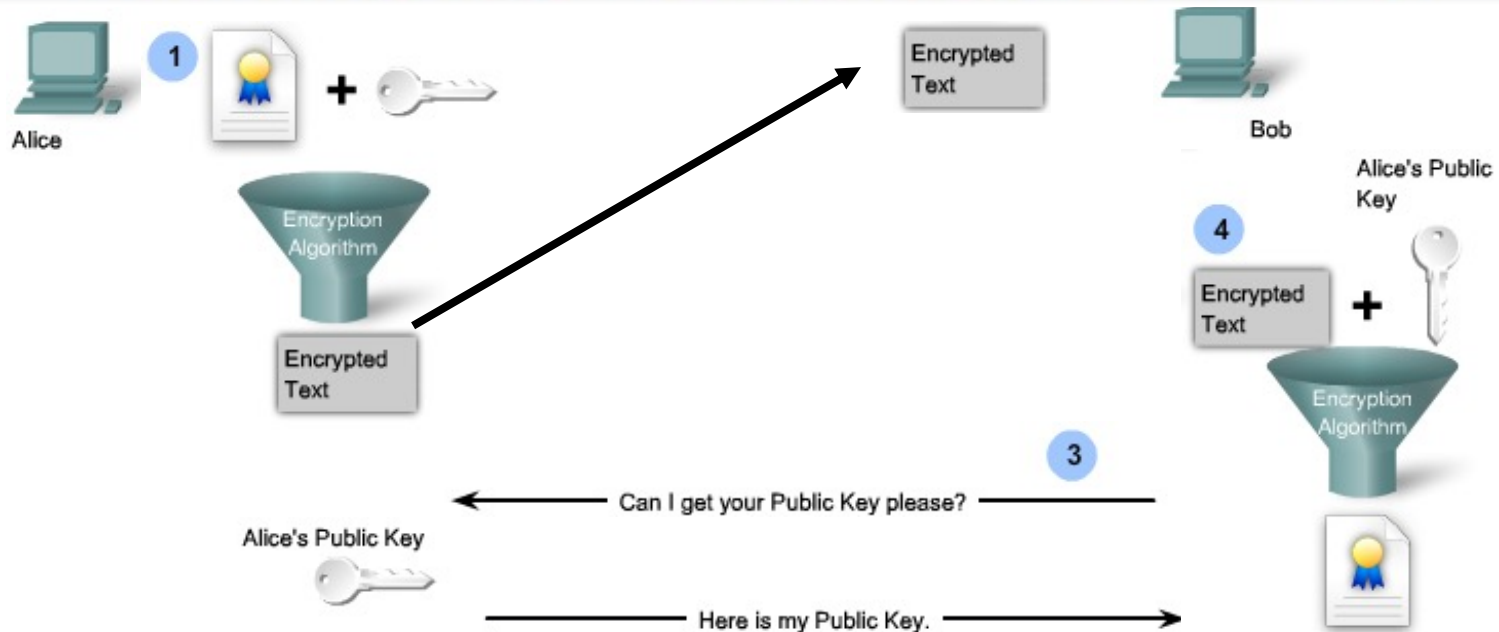

- Plaintext message M
 - F - asymmetric encryption algorithm
 - K_P (public key), K_S (private key)

$$M \rightarrow F(K_P, M) = C \rightarrow F(K_S, C) = M$$

$$M \rightarrow F(K_S, M) = C \rightarrow F(K_P, C) = M$$

Authentication

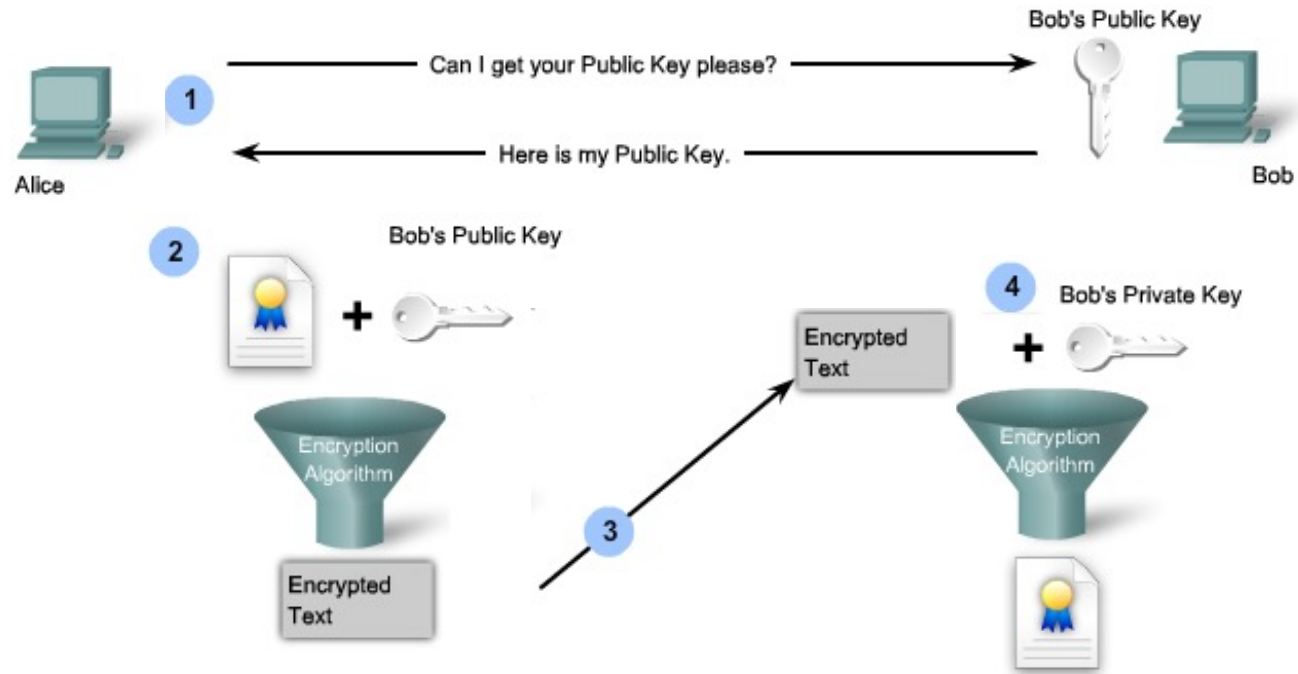

Private Key (Encrypt) + Public Key (Decrypt) = Authentication

1. Alice encrypts the message with its own private key.
2. Alice sends cipher-text to Bob
3. Bob asks for Alice's public key to verify the message.
4. To verify that the message comes from Alice, Bob uses Alice's public key to decipher it. If the message is readable, it is undeniable that Alice sent the message

Confidentiality

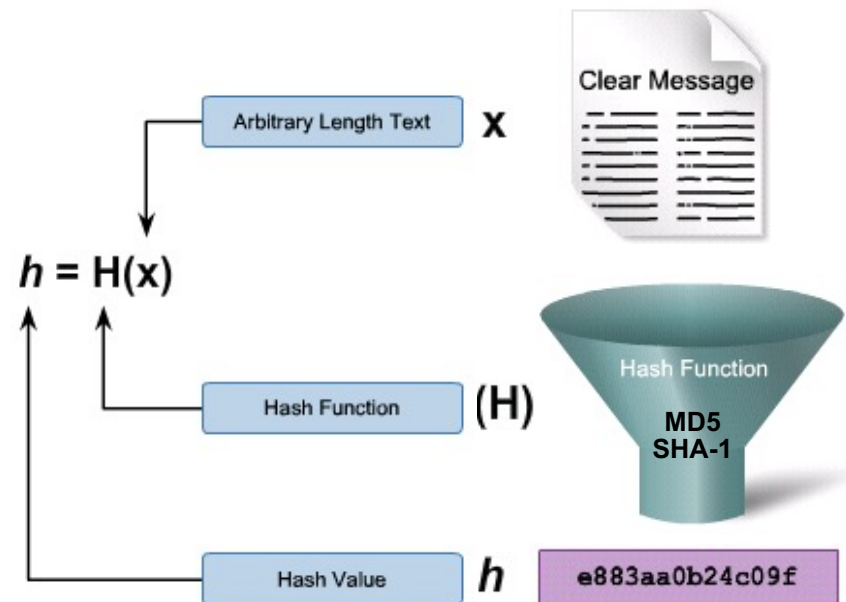

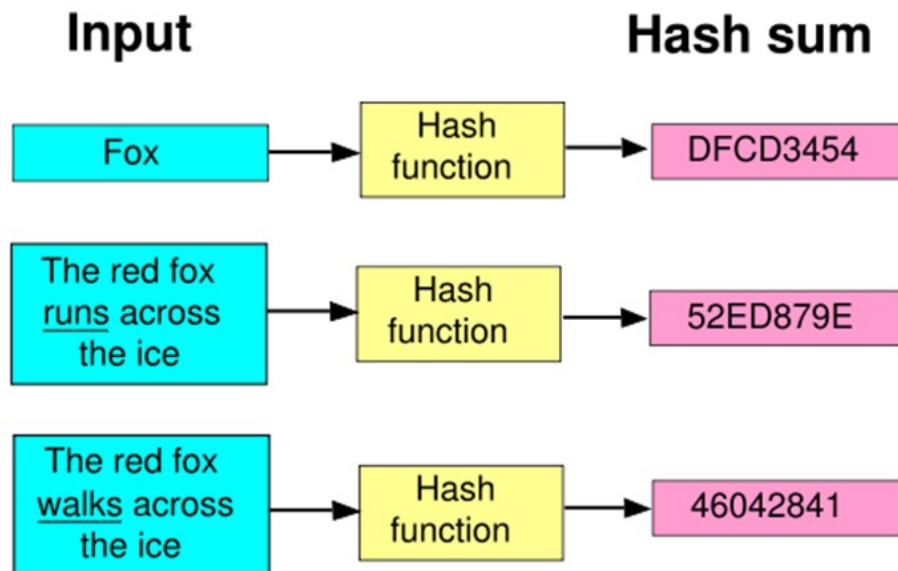

Public Key (Encrypt) + Private Key (Decrypt) = Confidentiality

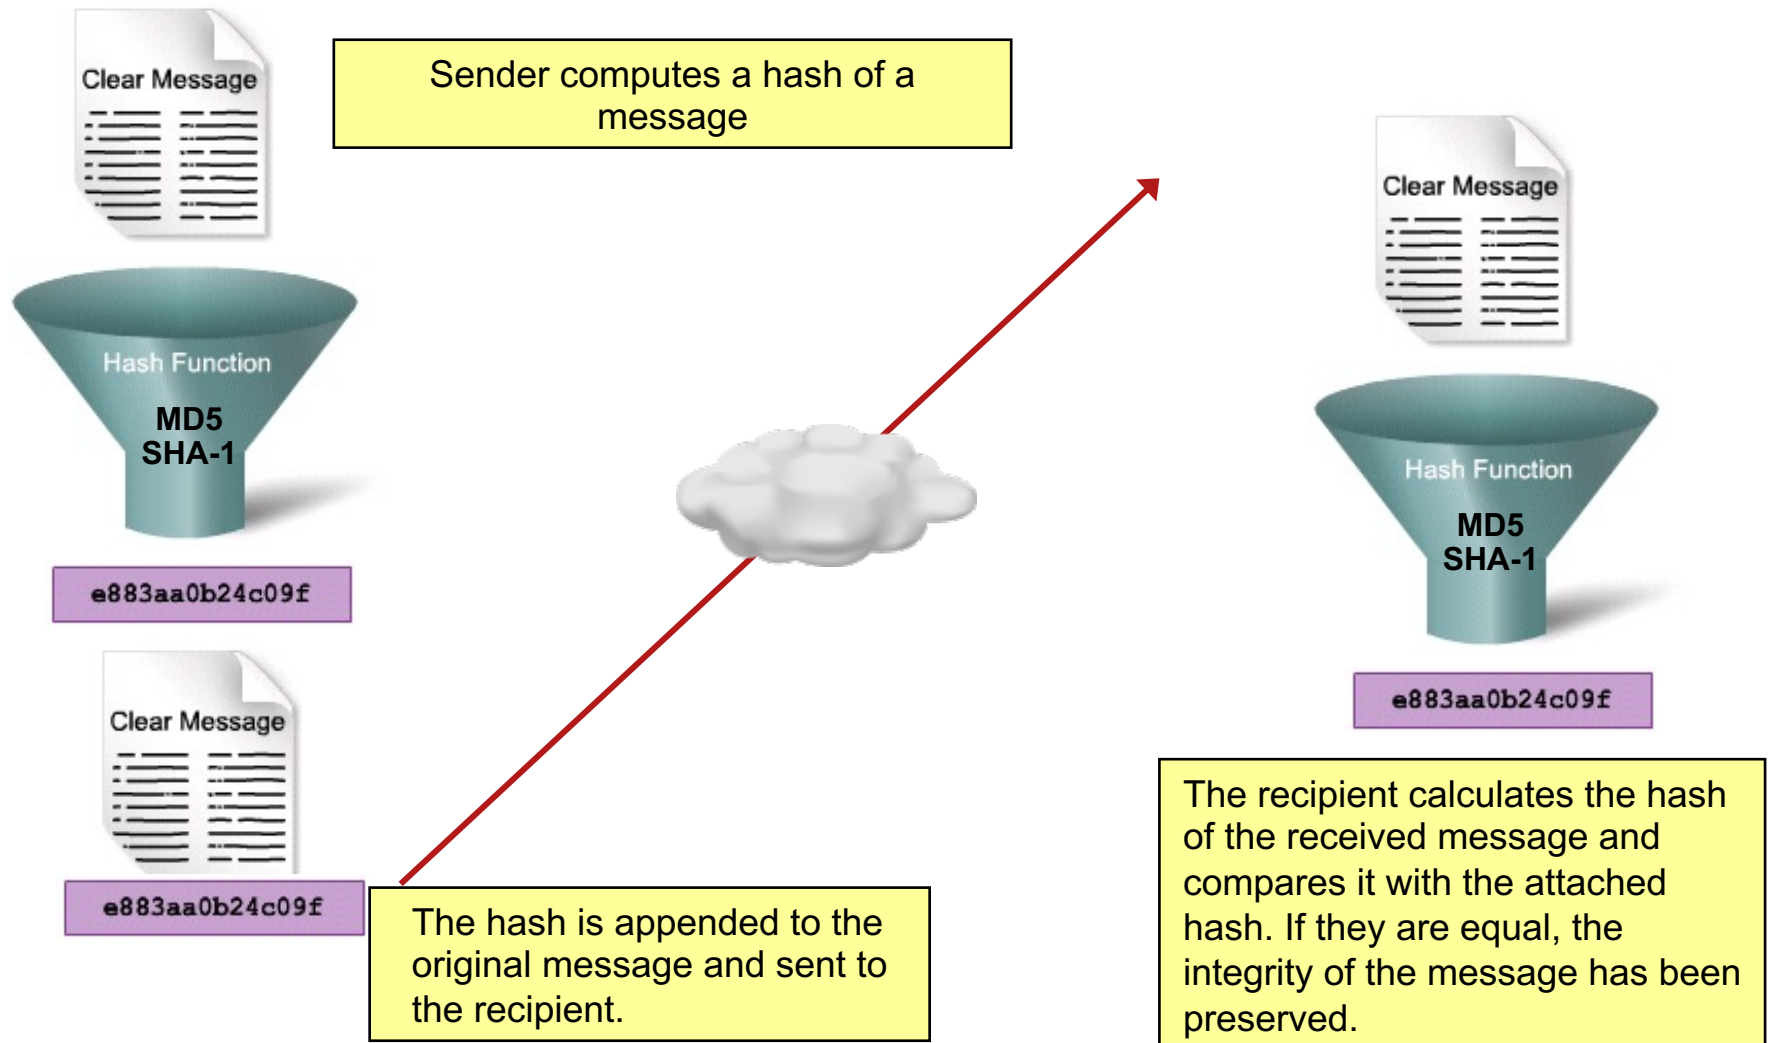

1. Alice asks Bob for his public key.
2. Alice uses Bob's public key to encrypt the message
3. Alice sends cipher-text to Bob.
4. Bob uses his private key to decrypt the message.

Hash

- A one-way mathematical hash function: takes binary data of arbitrary length as its input and produces a fixed-length output called a hash
- Hash is used to ensure integrity
- Hash function should be resistant to collisions

Integrity

Hash-based message authentication code

Data

| | |
|------------------------|----------|
| Pay to Terry Smith | \$100.00 |
| One Hundred and xx/100 | Dollars |

Secret Key

HMAC
(Authenticated
Fingerprint)

4ehIDx67NMop9

| | |
|------------------------|----------|
| Pay to Terry Smith | \$100.00 |
| One Hundred and xx/100 | Dollars |

4ehIDx67NMop9

Přijatá Data

| | |
|------------------------|----------|
| Pay to Terry Smith | \$100.00 |
| One Hundred and xx/100 | Dollars |

Secret Key

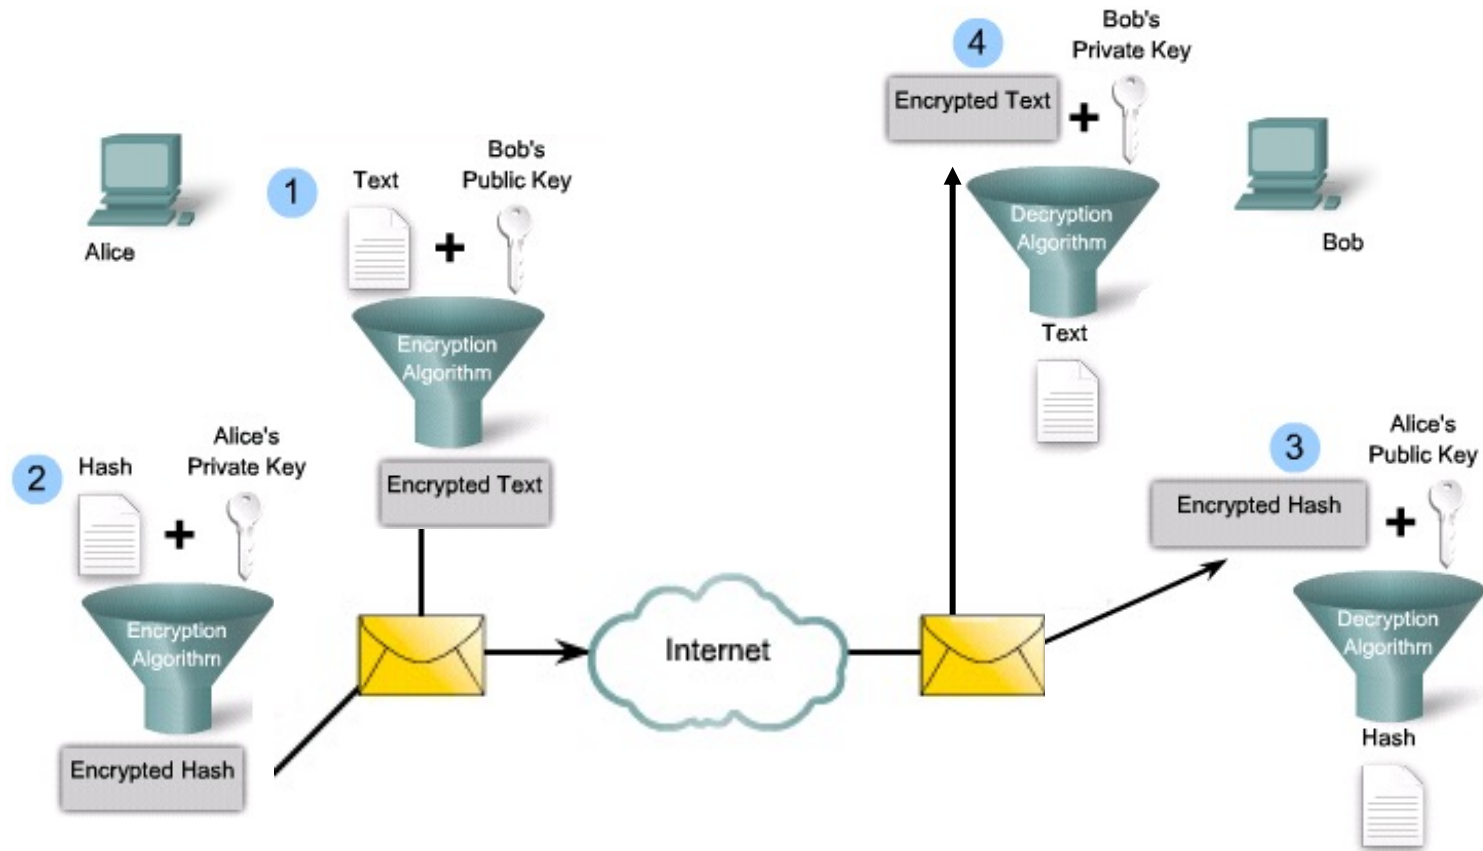

HMAC
(Authenticated
Fingerprint)

4ehIDx67NMop9

If the received HMAC equals the
calculated HMAC, the integrity and
authenticity is confirmed.

Assymmetric cryptography + HMAC

1. Alice encrypts the message using Bob's public key.
2. Alice encrypts HMAC with its own private key.
3. Bob uses Alice's public key to validate the HMAC message.
4. Bob uses his private key to decipher the cipher-text.

Asymmetric algorithms

| Algorithm | Key length (in bits) | Description |
|---------------------------------------------------------------------------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Diffie-Hellman (DH) 1976 | 512, 1024, 2048 | <p>Public key algorithm invented in 1976 by Whitfield Diffie and Martin Hellman that allows two parties to agree on a key that they can use to encrypt messages.</p> <p>Security depends on the assumption that it is easy to raise a number to a certain power, but difficult to compute which power was used given the number and the outcome.</p> |
| Digital Signature Standard (DSS) and Digital Signature Algorithm (DSA) 1994 | 512 - 1024 | <p>Created by NIST and specifies DSA as the algorithm for digital signatures.</p> <p>DSA is a public key algorithm based on the ElGamal signature scheme.</p> <p>Signature creation speed is similar with RSA, but is 10 to 40 times as slow for verification.</p> |
| RSA encryption algorithms 1977 | 512 to 2048 | <p>Developed by Ron Rivest, Adi Shamir, and Leonard Adleman at MIT in 1977.</p> <p>It is an algorithm for public-key cryptography based on the difficulty of factoring very large numbers.</p> <p>It is the first algorithm known to be suitable for signing as well as encryption, and one of the first great advances in public key cryptography.</p> <p>Widely used in electronic commerce protocols, and is believed to be secure given sufficiently long keys and the use of up-to-date implementations.</p> |
| ElGamal | 512 - 1024 | <p>An asymmetric key encryption algorithm for public-key cryptography which is based on the Diffie-Hellman key agreement.</p> <p>Developed in 1984 and used in GNU Privacy Guard software, PGP, and other cryptosystems.</p> <p>A disadvantage is that the encrypted message becomes very big, about twice the size of the original message and for this reason it is only used for small messages such as secret keys.</p> |
| Elliptical curve techniques | 160 | <p>Elliptic curve cryptography was invented by Neil Koblitz in 1987 and by Victor Miller in 1986.</p> <p>Can be used to adapt many cryptographic algorithms, such as Diffie-Hellman or ElGamal.</p> <p>The main advantage of elliptic curve cryptography is that the keys can be much smaller.</p> |

Public Key Infrastructure (PKI)

- Verifying that the private/public keys are actually owned by the user = certificate
- Hierarchy of certificate holders and certification authorities
- Certification Authority = a trusted organization that issues certificates

Possible ways to obtain Anonymity

- VPN
- Proxy
- Onion routing
- Garlic routing
- P2P network
- End-to-end encryption

A CRYPTO NERD'S
IMAGINATION:

HIS LAPTOP'S ENCRYPTED.
LET'S BUILD A MILLION-DOLLAR
CLUSTER TO CRACK IT.

NO GOOD! IT'S
4096-BIT RSA!

BLAST! OUR
EVIL PLAN
IS FOILED!

WHAT WOULD
ACTUALLY HAPPEN:

HIS LAPTOP'S ENCRYPTED.
DRUG HIM AND HIT HIM WITH
THIS \$5 WRENCH UNTIL
HE TELLS US THE PASSWORD.

GOT IT.

<https://xkcd.com/538/>

VPN ①

33

VPN ②

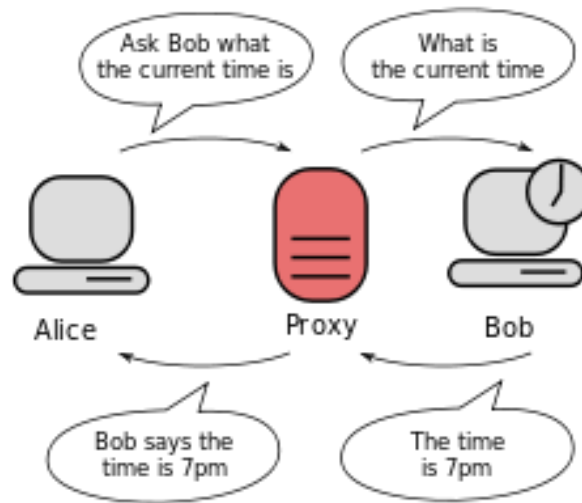

- ISP cannot inspect communication
- The user acts as someone else (from IP level)
- Can „unlocking“ some internet services
- VPN provider has information who has joined from what address
- Transparent for all applications
- Payment Bitcoins
- Many providers: ipredator, privateinternetaccess, torguard, btguard...

Proxy

Proxy

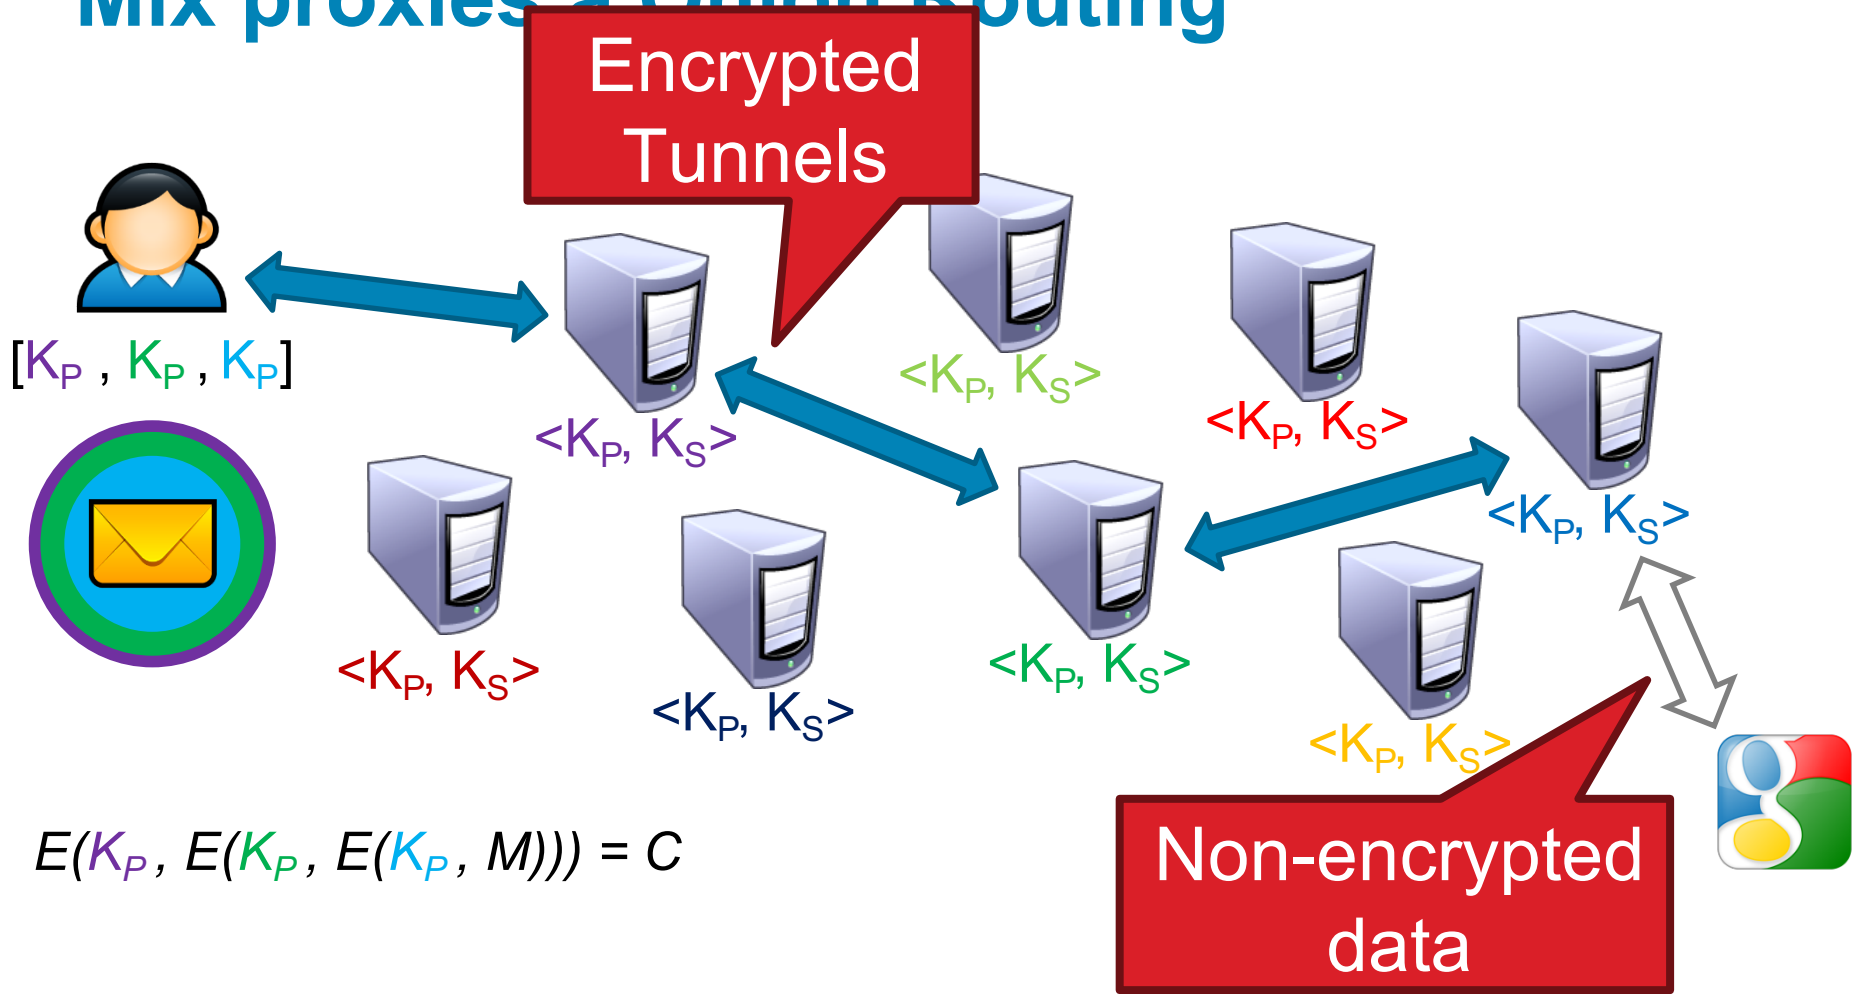

- Similar to VPN
- Traffic go through a proxy server
- HTTP, SOCK proxy

Mix networks, onion routing

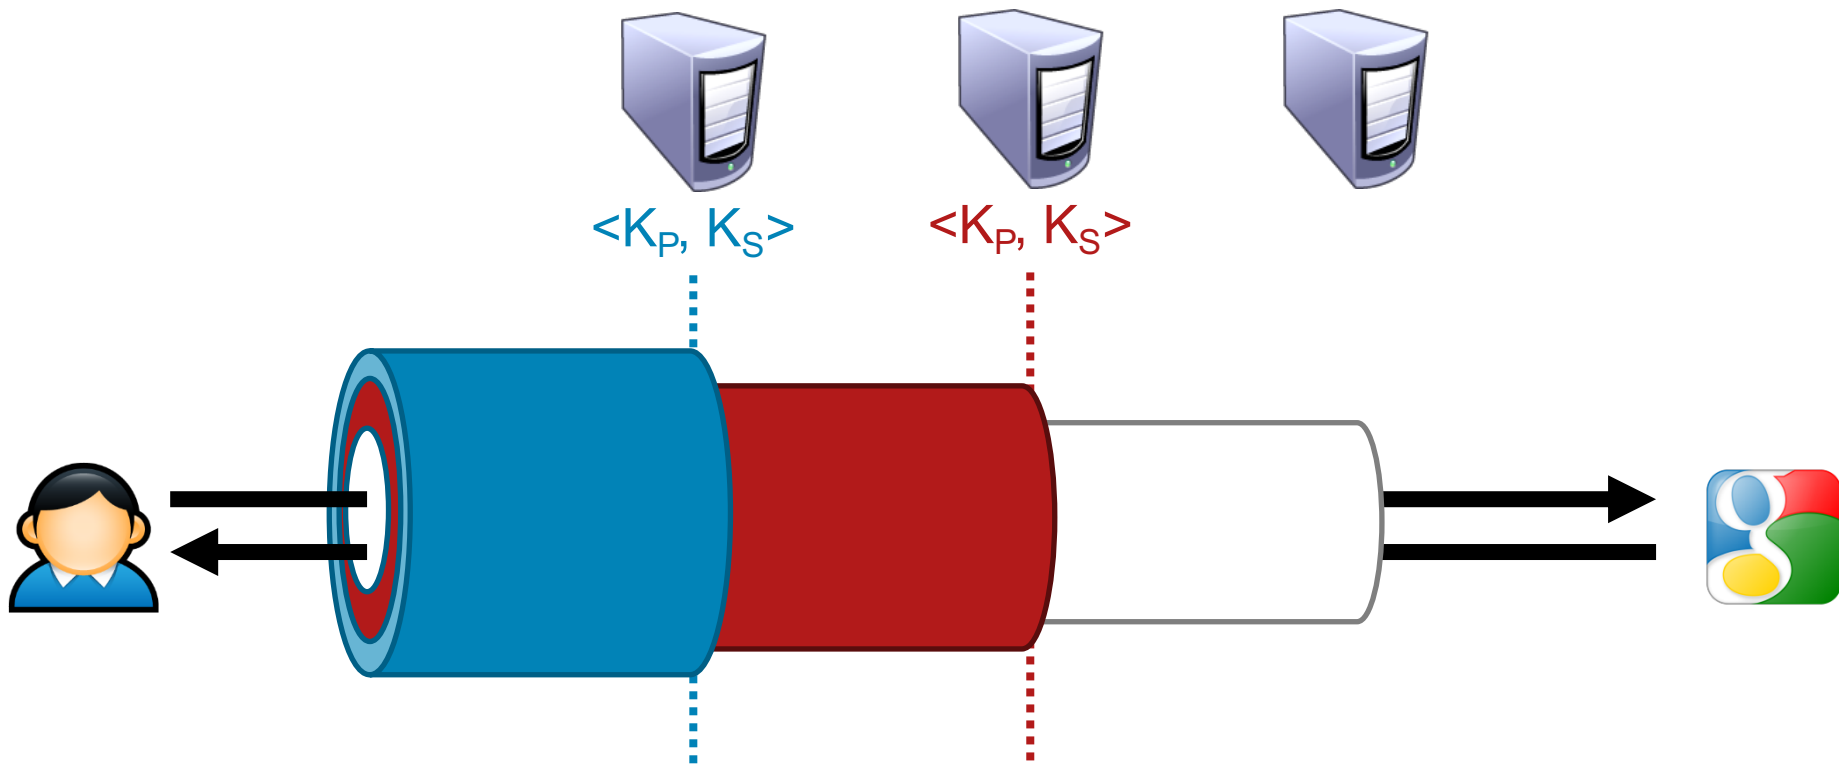

- Chaum, David L. "Untraceable electronic mail, return addresses, and digital pseudonyms." *Communications of the ACM* 24.2 (1981): 84-90.
- Inspiration for:
 - Onion routing
 - Traffic mixing
 - Dummy traffic (cover traffic)

Mix proxies a Onion Routing

$$E(K_P, E(K_P, E(K_P, M))) = C$$

- Cascade of anonymous proxies/servers
- Traffic is encrypted

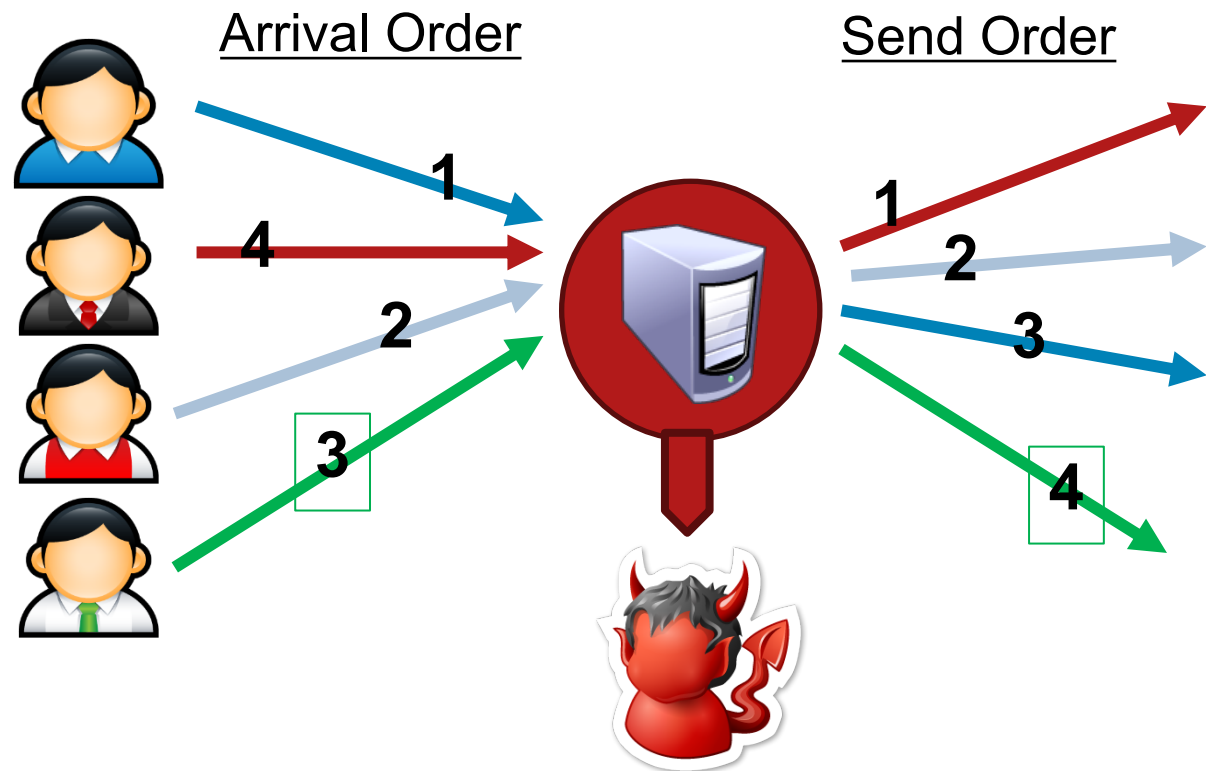

Return Traffic

- What about return traffic?
- Sender can leave keys on the path

Traffic Mixing

- Protection against timing attacks
- Disadvantages:
 - Needs heavy traffic
 - Add delay/latency

Dummy / Cover Traffic

- Sending cover traffic that is discarded in the network

Torproject.org

- Advanced mix network:
 - **Guards**: enhance source anonymity
 - **Relays**: mix proxy
 - **Hidden services**: servers accesible only through Tor (darknet)
- ~5000 Tor relays
 - Run by volunteers, universities, organisations
 - It's expected that some run by „intelligence agencies“
- 1 – 2 mil. users

Torproject.org

Directly connecting users

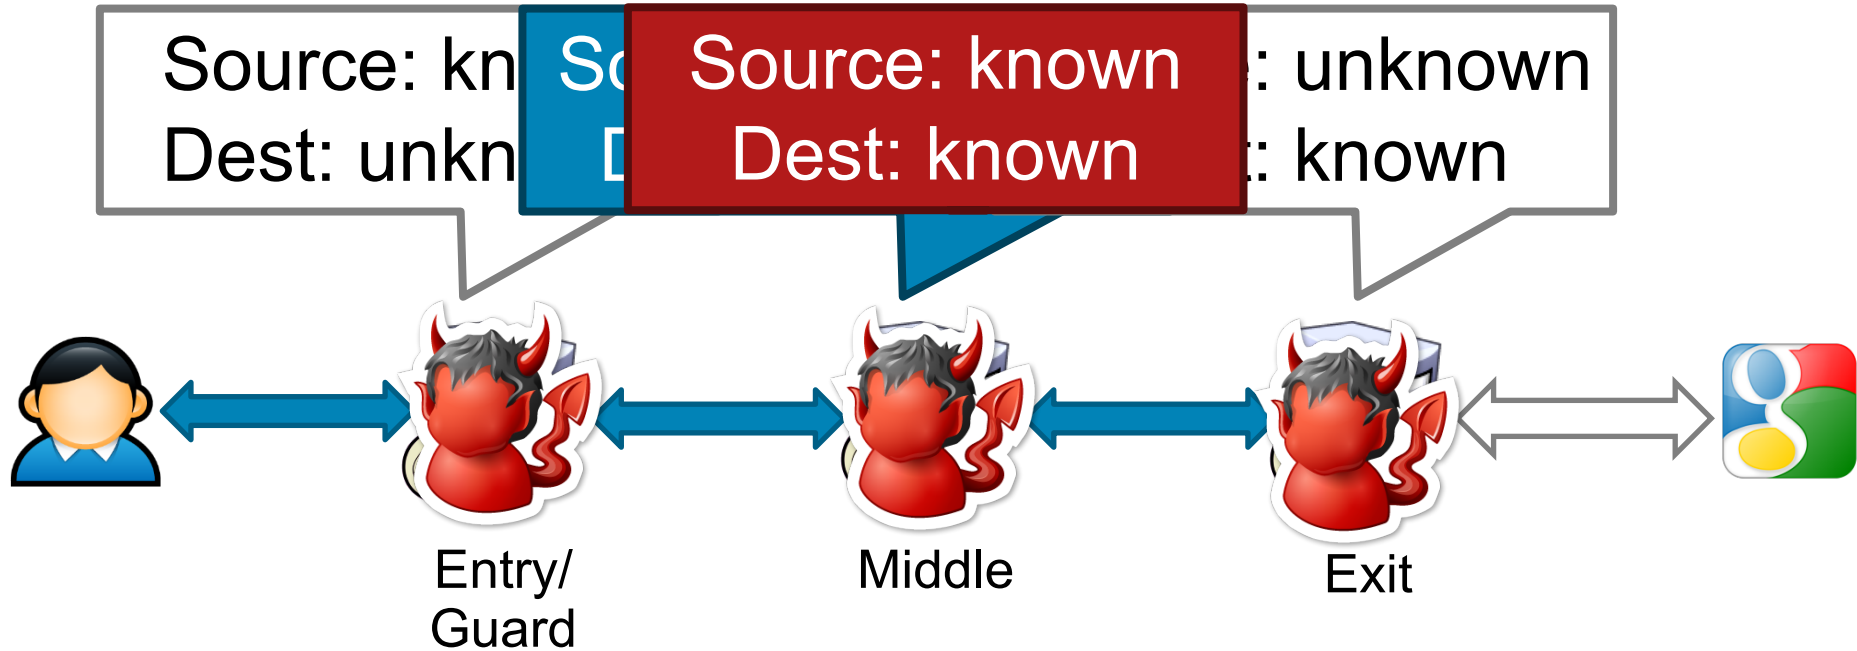

The Tor Project - <https://metrics.torproject.org/>

Torproject.org

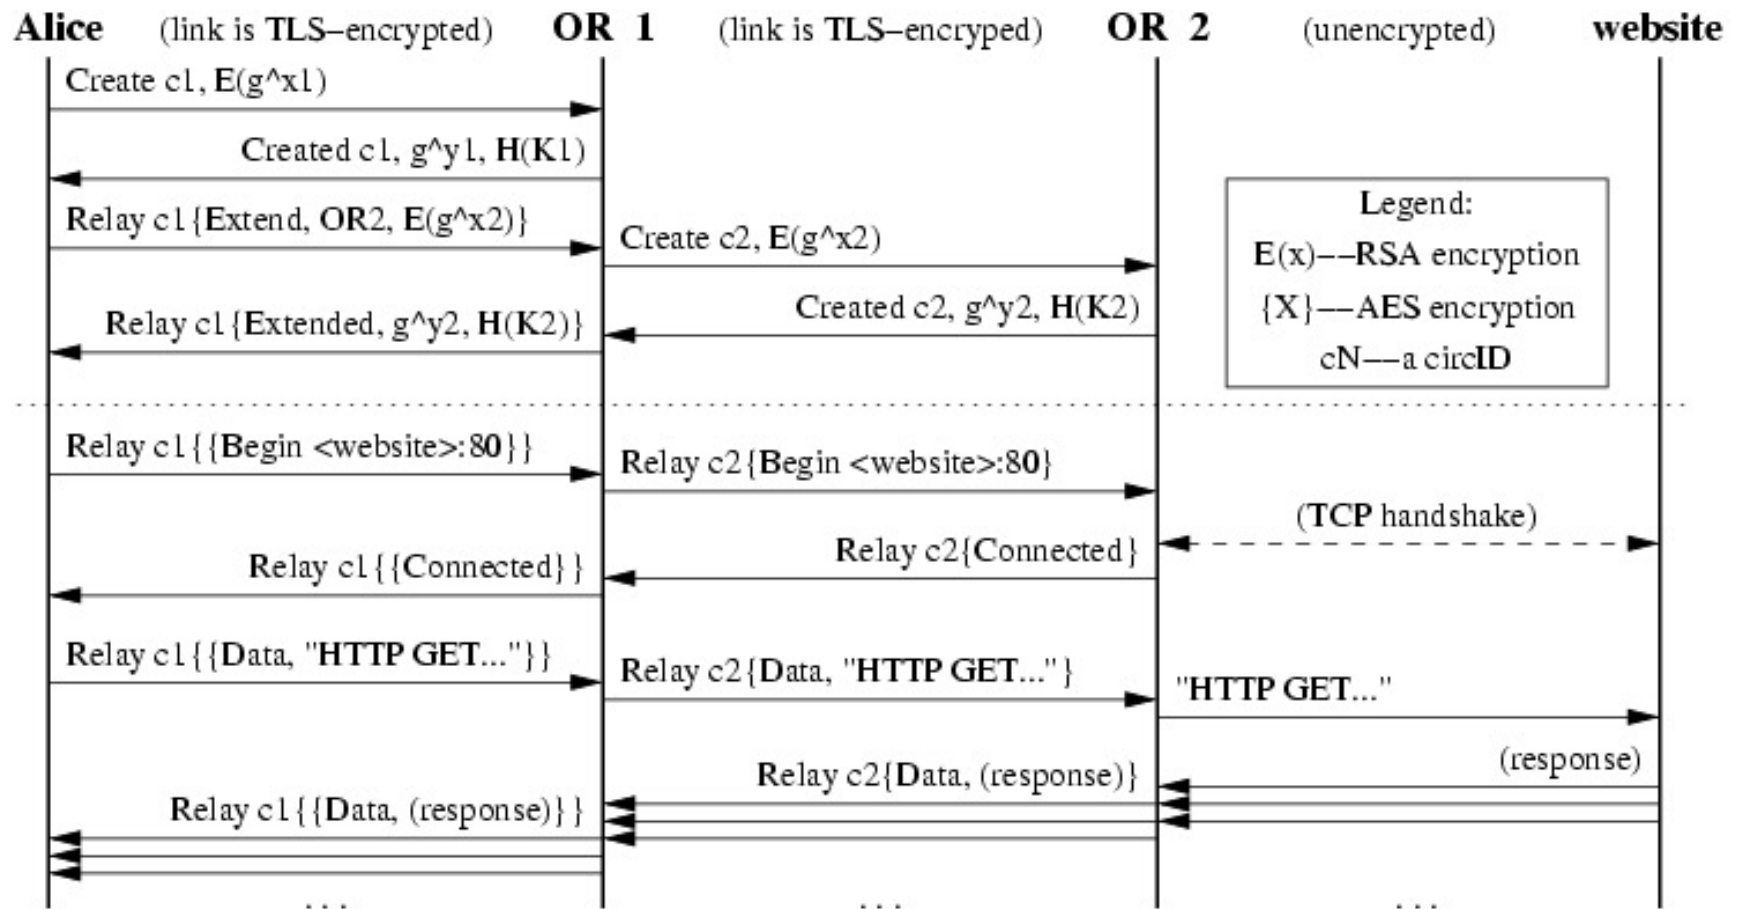

- Tor client acts as a SOCKS proxy
 - Creates and manages **circuits**
- Support for all application that can connect via SOCKS proxy
- How to find a Tor relay?
 - Tor Consensus File
 - Hosted by **directory** servers
 - IP addresses of all known relays
 - IP address, uptime, measured bandwidth, etc.
- Packets are divided to cells 512 bajtů
 - Decrease speed, increase anonymity
- <https://gitweb.torproject.org/torspec.git/blob/HEAD:/tor-spec.txt>

Tor Circuits

- Number of relays can be selected
 - Implicitně 3

Communication example

Guard Relays

- Guard relays protect against attacker that acts as an entry relay
 - Tor picks 3 guard relays and uses them for some time
 - The latest Tor version chooses only one guard relay. Why?
- Guard relay:
 - Large uptime
 - Bandwidth

Guard relays attack

- Assumption:
 - N : number of relays
 - M : number of relays controlled by an attacker
- Attacker's goal – control entry and exit relay
 - $\sim M/N$ probability for entry relay
 - $\sim (M-1)/(N-1)$ probability for exit relay
 - $\sim (M/N)^2$ probability for one circuit
- Client creates new circuits
 - Attacker chance increase during long time period

Hidden services

- Web services can be easily monitored
- Tor Hidden Services
 - Allows run an anonymous server without exposing its IP address or DNS name
- Services
 - Tor Mail, Tor Char
 - DuckDuckGo
 - Wikileaks
 - The Pirate Bay, Silk Road ...

Tor Hidden Services: 1

Step 1: Bob picks some introduction points and builds circuits to them.

| | |
|-------------------------------------------------------------------------------------|---------------------|
|  | Tor cloud |
|  | Tor circuit |
|  | Introduction points |
|  | Public key |
|  | One-time secret |
|  | Rendezvous point |

Tor Hidden Services: 2

Step 2: Bob advertises his hidden service -- XYZ.onion -- at the database.

-  Tor cloud
-  Tor circuit
-  IP1-3 Introduction points
-  PK Public key
-  cookie One-time secret
-  RP Rendezvous point

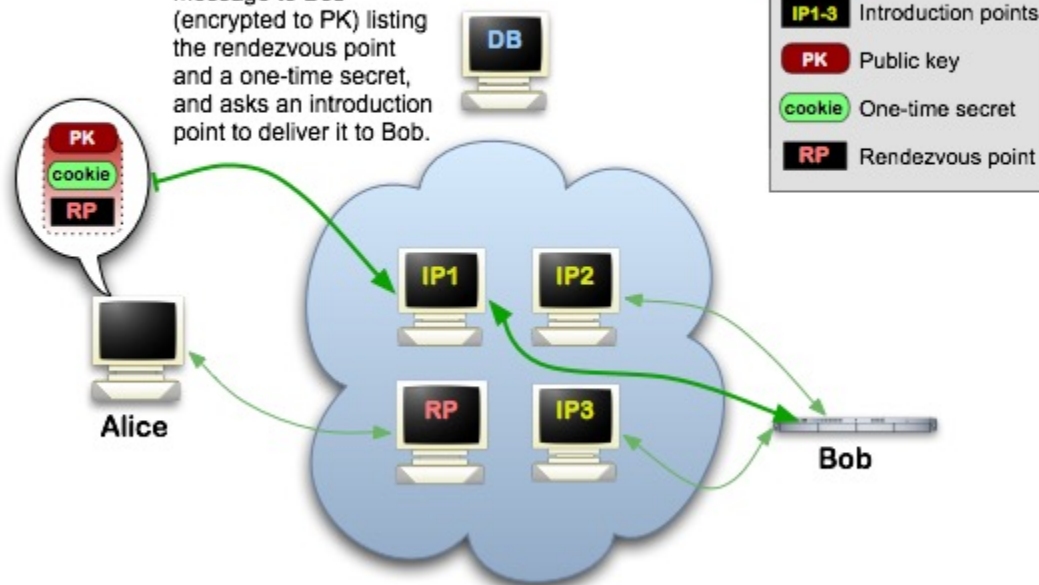

Tor Hidden Services: 3

Step 3: Alice hears that XYZ.onion exists, and she requests more info from the database. She also sets up a rendezvous point, though she could have done this before.

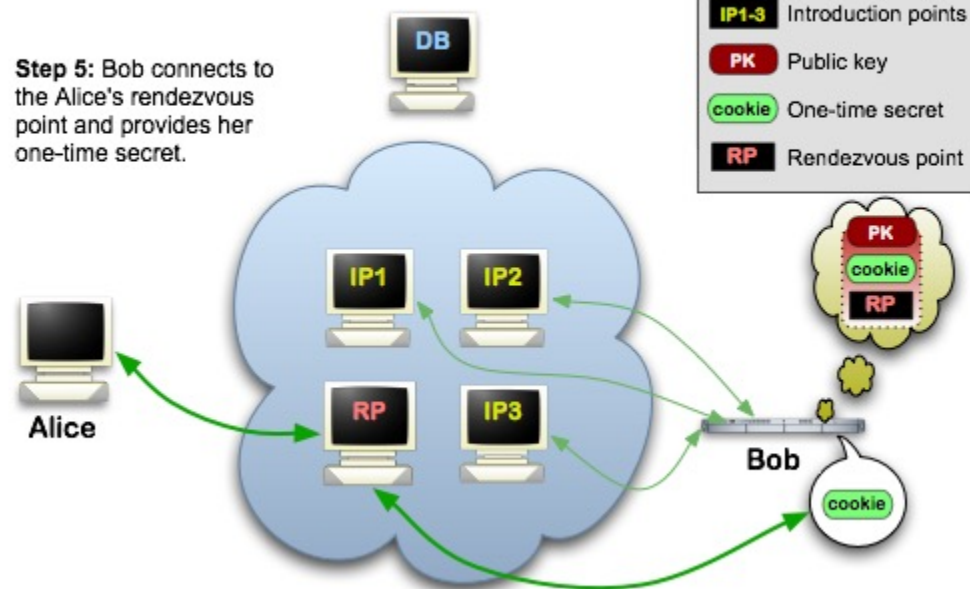

Tor Hidden Services: 4

Step 4: Alice writes a message to Bob (encrypted to PK) listing the rendezvous point and a one-time secret, and asks an introduction point to deliver it to Bob.

Tor Hidden Services: 5

Step 5: Bob connects to the Alice's rendezvous point and provides her one-time secret.

Tor Hidden Services: 6

Step 6: Bob and Alice proceed to use their Tor circuits like normal.

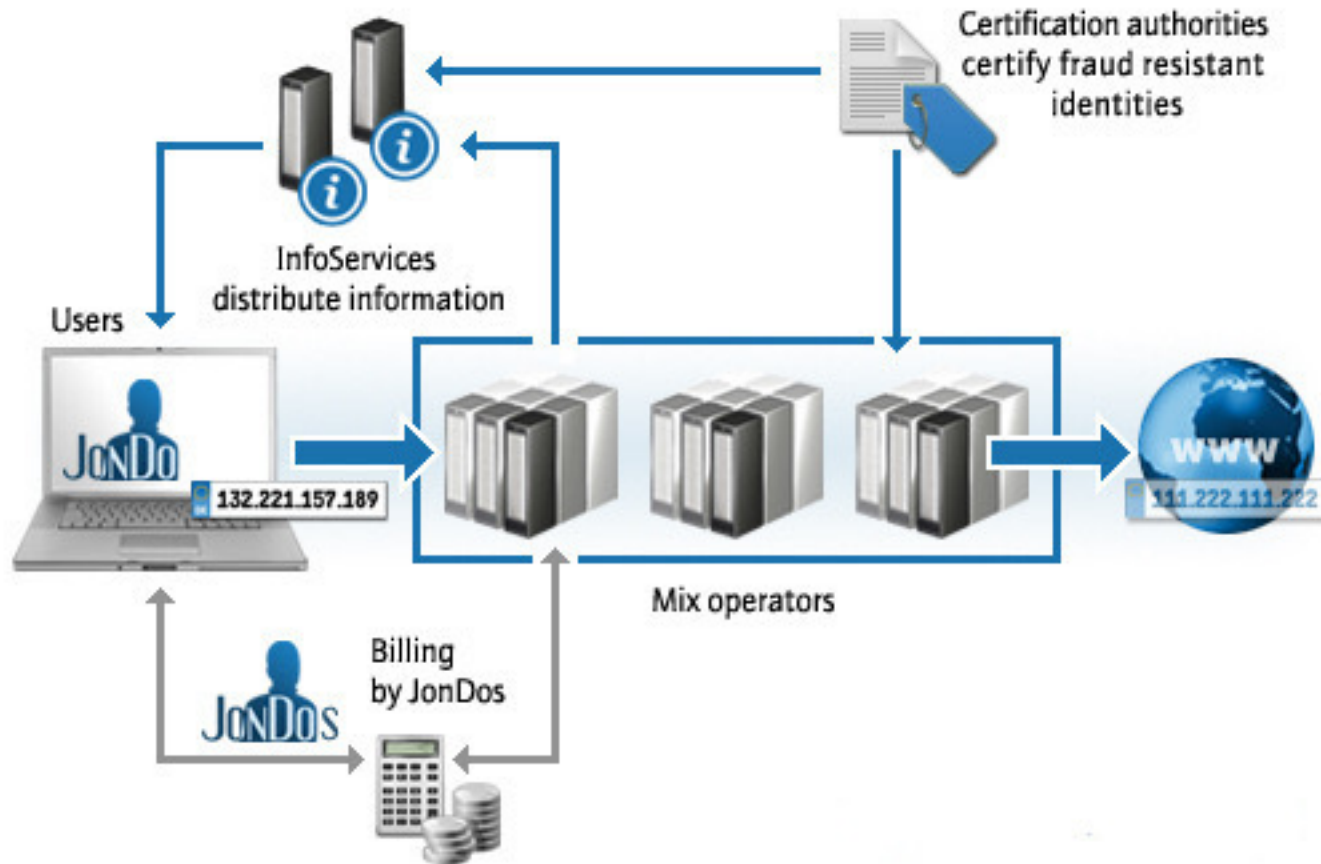

-  Tor cloud
-  Tor circuit
-  Introduction points
-  Public key
-  One-time secret
-  Rendezvous point

Tor Bridges

- Tor relays is publicly accessible
- Some countries block these IPs
 - DoS vůči Tor
- Tor Bridges
 - Tor proxy, that is not included in the directory
- Tor packets can be detected using the DPI (fix cells)
 - Traffic obfuscating – traffic acts as HTTP, Bittorrent ...

JohnDonym

Other projects

- Snapchat – message can be destroyed after some time
 - <http://ridgewood.patch.com/groups/police-and-fire/p/nude-photos-of-ridgewood-high-girls-prompt-police-investigation>
